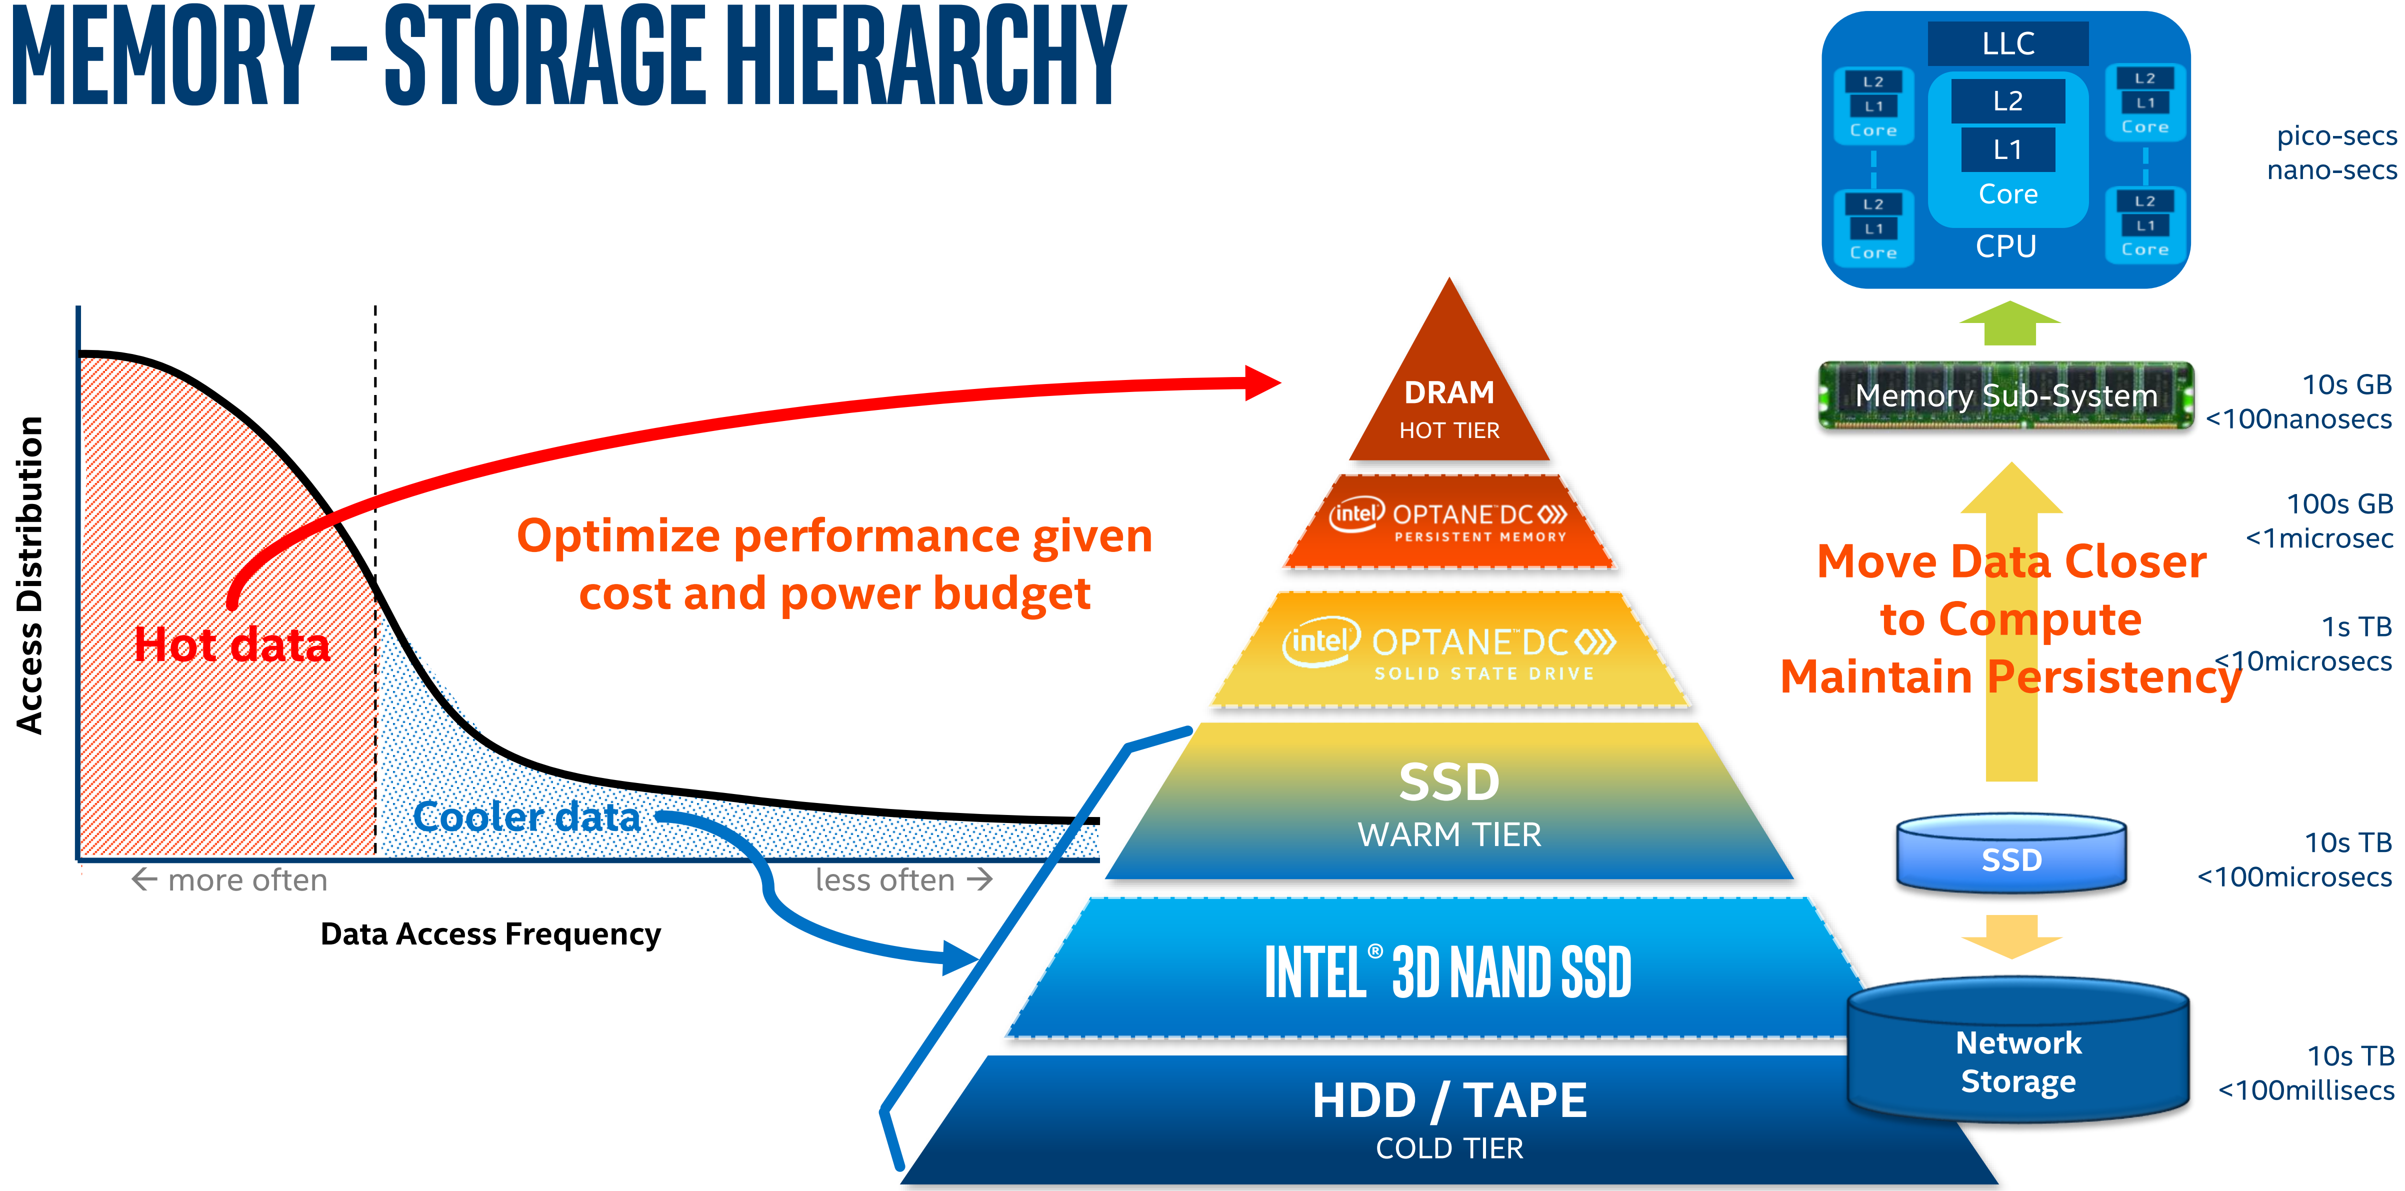
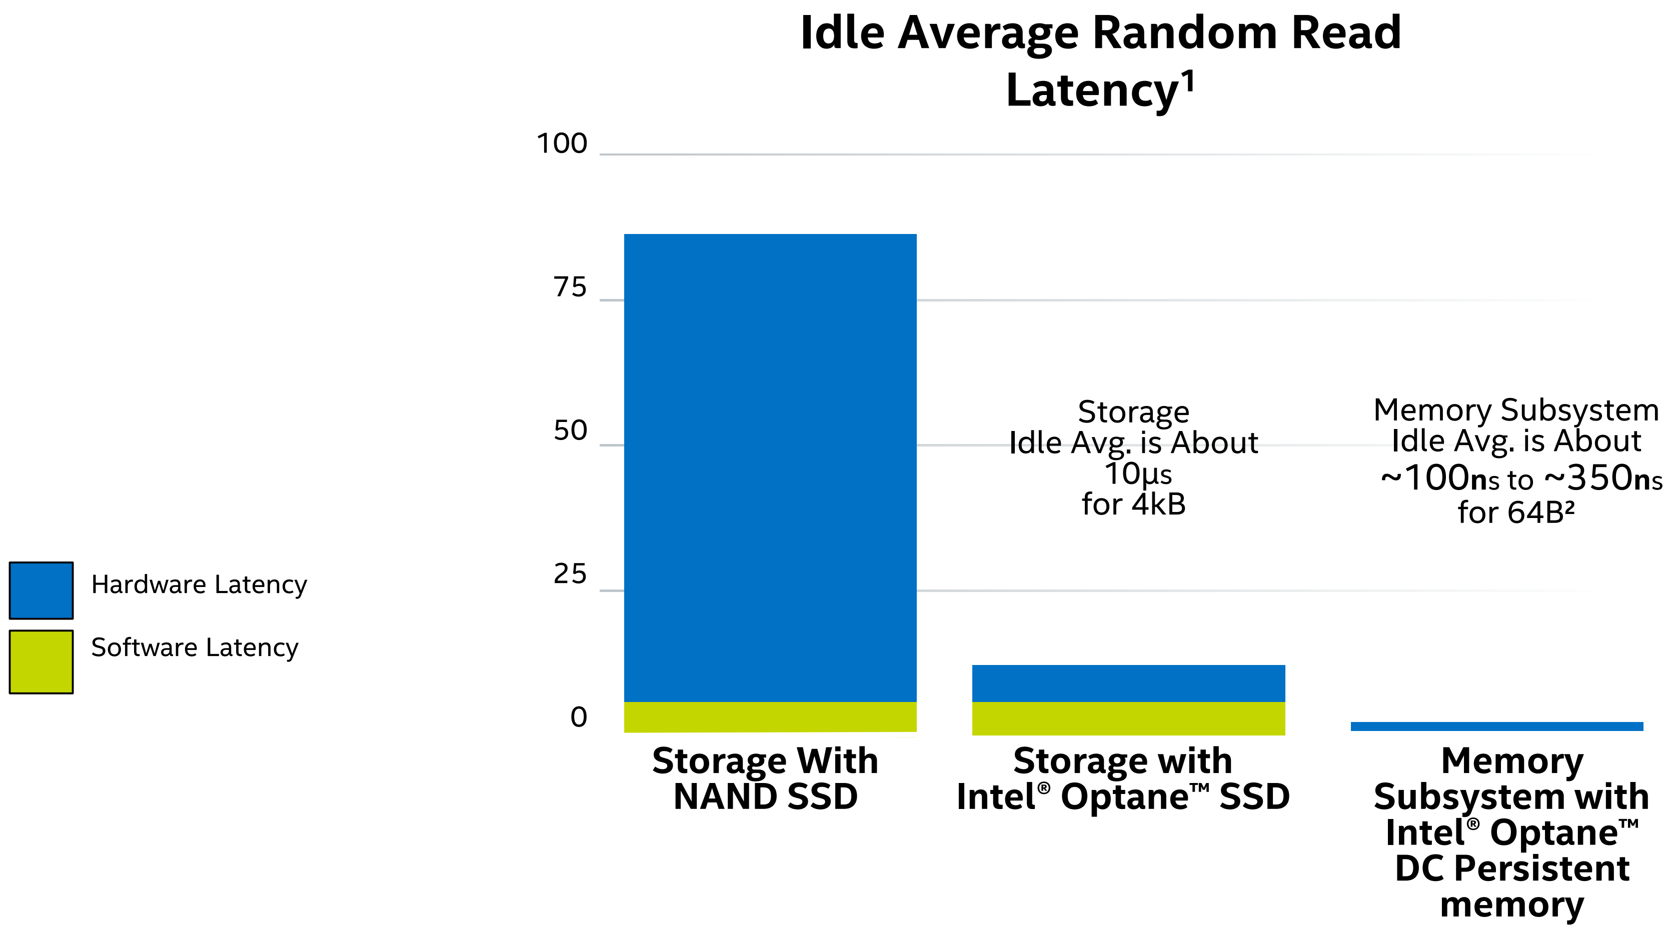
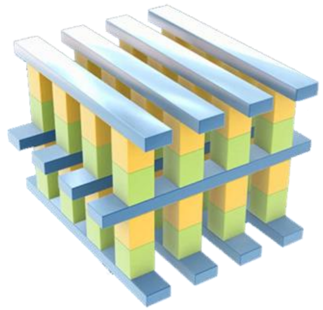
INTRODUCTION TO PROGRAMMING FOR PERSISTENT MEMORY

MEMORY – STORAGE HIERARCHY



MEMORY – STORAGE HIERARCHY





[1] Source: Intel-tested: Average read latency measured at queue depth 1 during 4k random write workload. Measured using FIO 3.1. comparing Intel Reference platform with Optane™ SSD DC P4800X 375GB and Intel® SSD DC P4600 1.6TB compared to SSDs commercially available as of July 1, 2018. Performance results are based on testing as of July 24, 2018 and may not reflect all publicly available security updates. See configuration disclosure for details. No product can be absolutely secure. For more complete information about performance and benchmark results, visit www.intel.com/benchmarks.

[2] App Direct Mode , NeonCity, LBG B1 chipset , CLX B0 28 Core (QDF QQYZ), Memory Conf 192GB DDR4 (per socket) DDR 2666 MT/s, Optane DCPMM 128GB, BIOS 561.D09, BKC version WW48.5 BKC, Linux OS 4.18.8-100.fc27, Spectre/Meltdown Patched (1,2,3, 3a)

LATENCY AT HUMAN SCALE

System Event	Actual Latency	Scaled Latency
One CPU cycle	0.4 ns (1 cycle)	**1 s**
Level 1 cache access	2 ns (5 cycles)	**5 s**
Level 2 cache access	4.8 ns (12 cycles)	**12 s**
Level 3 cache access	26 ns (65 cycles)	**1 min 5sec**
Main memory access (DDR DIMM)	<100 ns	**4 min 10sec**
NVDIMM-N memory access	<100 ns	**4 min 10sec**
Intel Optane DC Persistent Memory access	<100-300 ns	**4 min 10sec - 12 min**
Intel Optane DC SSD I/O P4800X NVMe	~10 µs	**~7hrs**
NVMe SSD I/O	~25 µs	**17 hrs 21min**
SSD I/O	50–150 µs	**1 day 11hrs – 4 days, 8hrs**
Rotational disk I/O	1–10 ms	**28 days 22hrs – 289 days**
Tape	~100ms	**7 yrs 11 months**

From “Systems Performance: Enterprise and the Cloud”, Brendan Gregg

WHAT IS PERSISTENT MEMORY?

- Byte or block addressable
- load/store memory access
- persistence properties of storage

JEDEC NVDIMM Standards			
	NVDIMM-F	NVDIMM-N	NVDIMM-P
IO Access Methods	Block	Block or Byte	Block or Byte
Capacity	100’s GB – 1's TB	1's - 10's GB	100’s GB – 1's TB
Latency	<50us	<100ns	<300ns
First Availability	2014	2016	2019
Operating System Support	Linux Kernel x.x Windows?	Linux Kernel >4.0 Windows Server 2016	Linux Kernel >4.2 Windows Server 2019

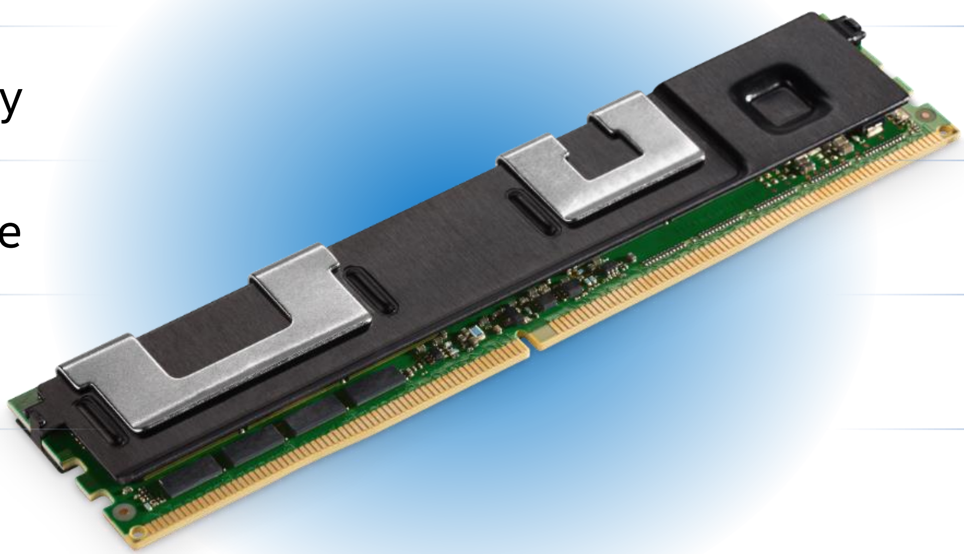
intel OPTANE™ DC
PERSISTENT MEMORY

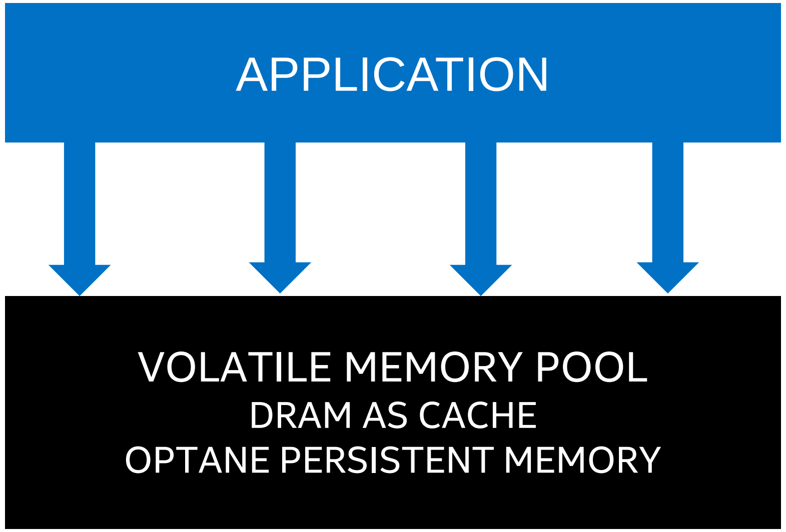
Big and Affordable Memory	128, 256, 512GB
Highest Performance Storage	DDR4 Pin Compatible
Direct Load/Store Access	Hardware Encryption
Native Persistence	High Reliability



PERSISTENT MEMORY USAGE MODES

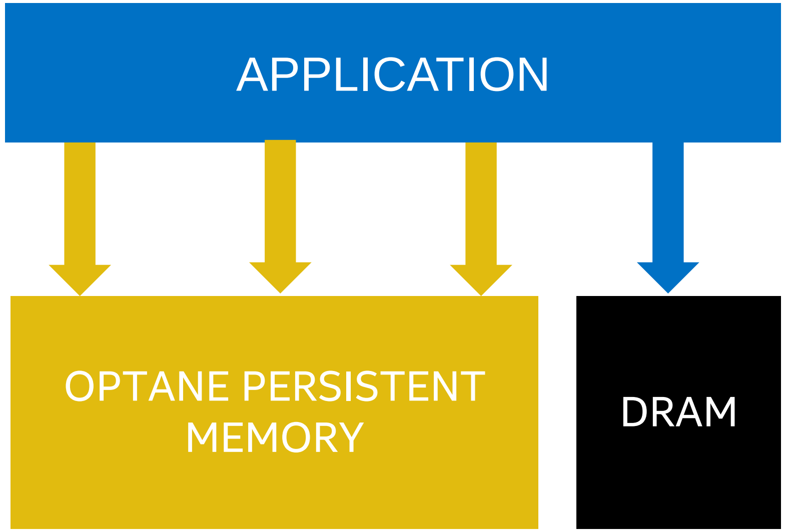
Memory Mode

Affordable memory capacity for many applications



APP Direct Mode

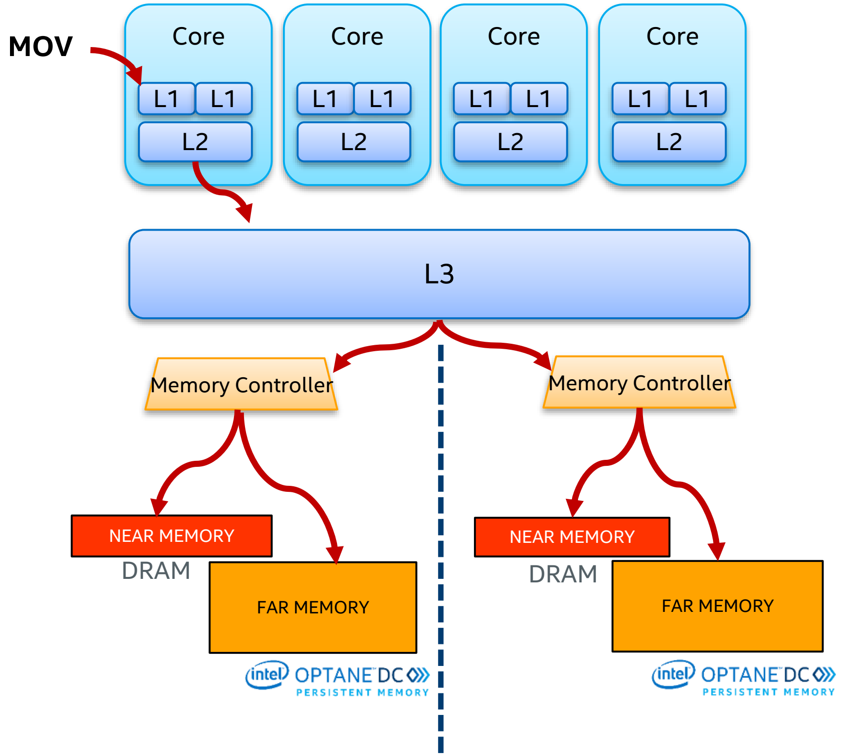
Persistent & maximum capacity



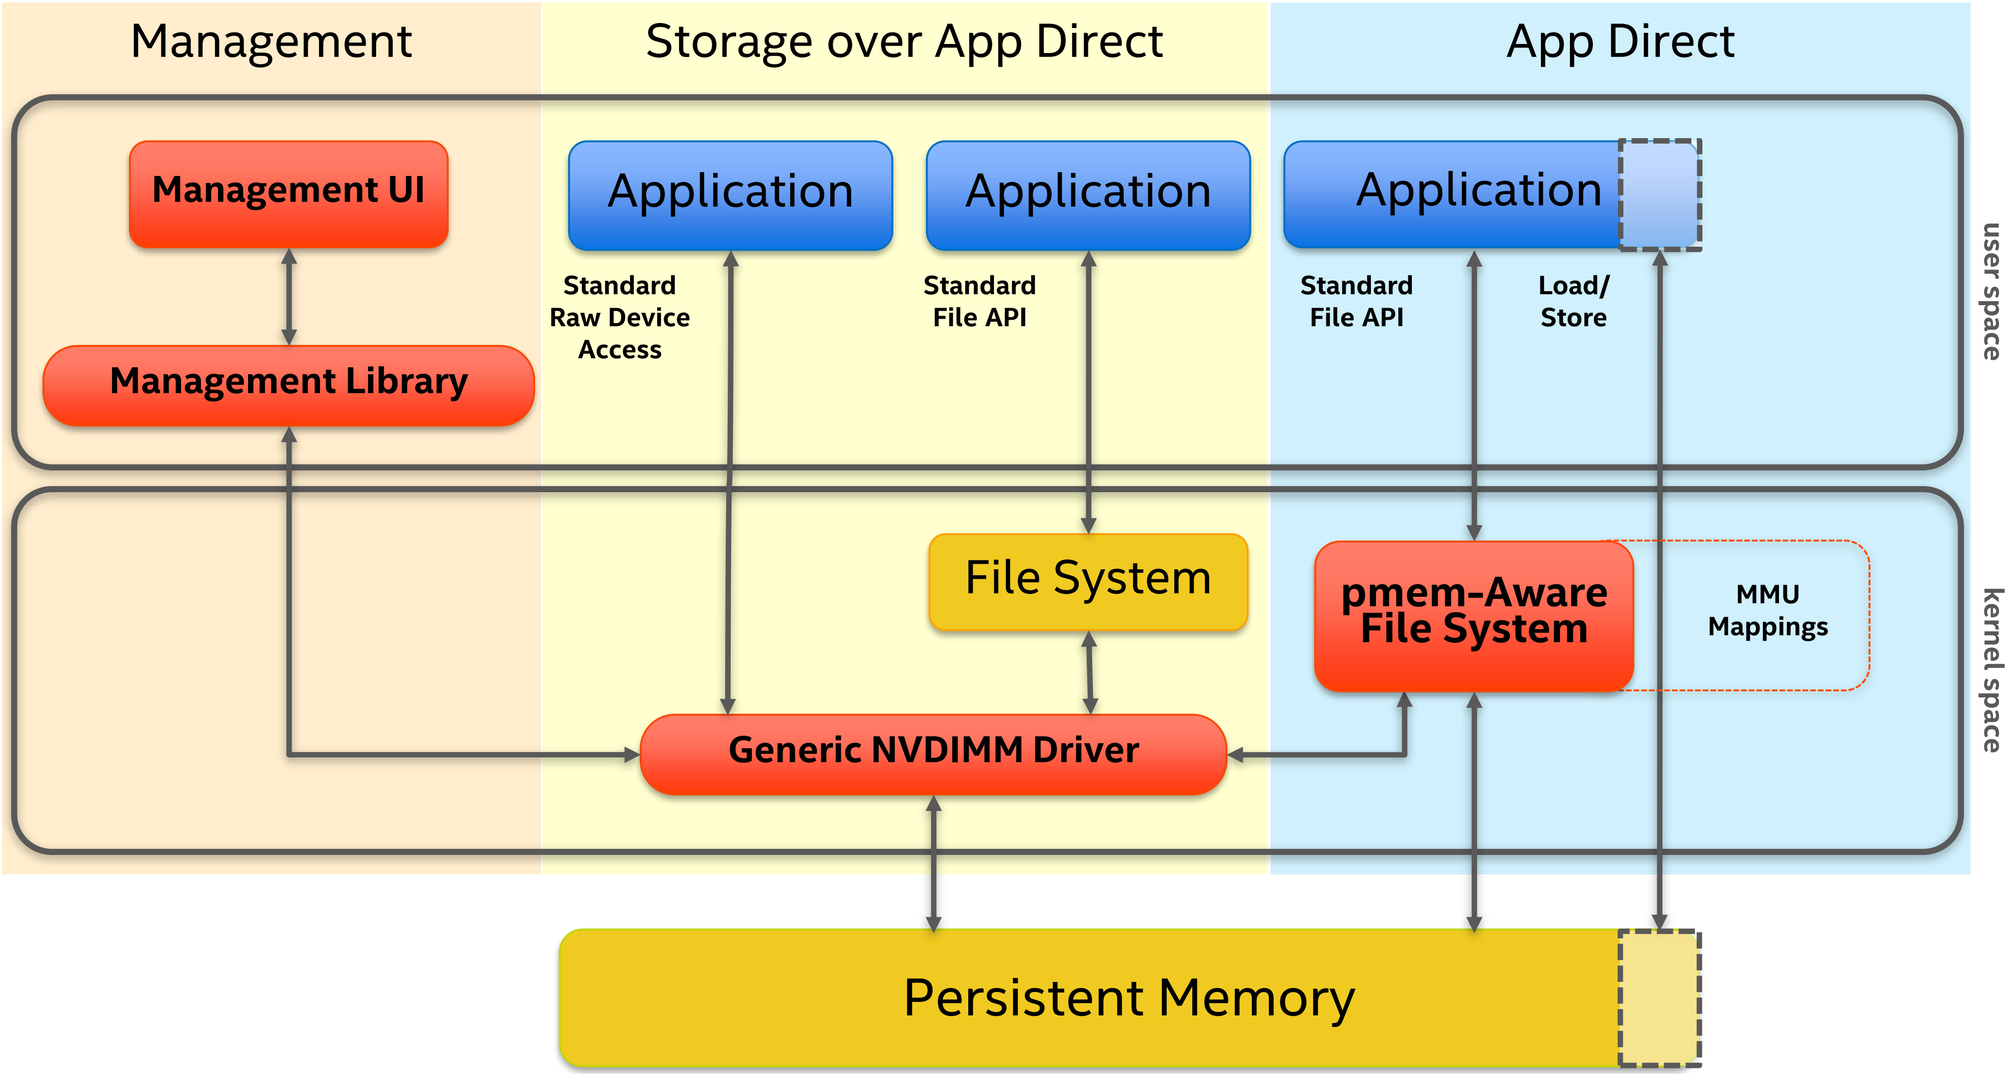
PERSISTENT MEMORY USAGE MODES

Memory Mode details

- No software/application changes required
- To mimic traditional memory, data is “volatile”
  - Volatile mode key cleared and regenerated every power cycle
- DRAM is “near memory”
- Used as a write-back cache
- Managed by host memory controller
- Within the same host memory controller, not across
- Ratio of far/near memory (PMEM/DRAM) can vary
- Overall latency
- Same as DRAM for cache hit
- Intel® Optane™ DC persistent memory + DRAM for cache miss



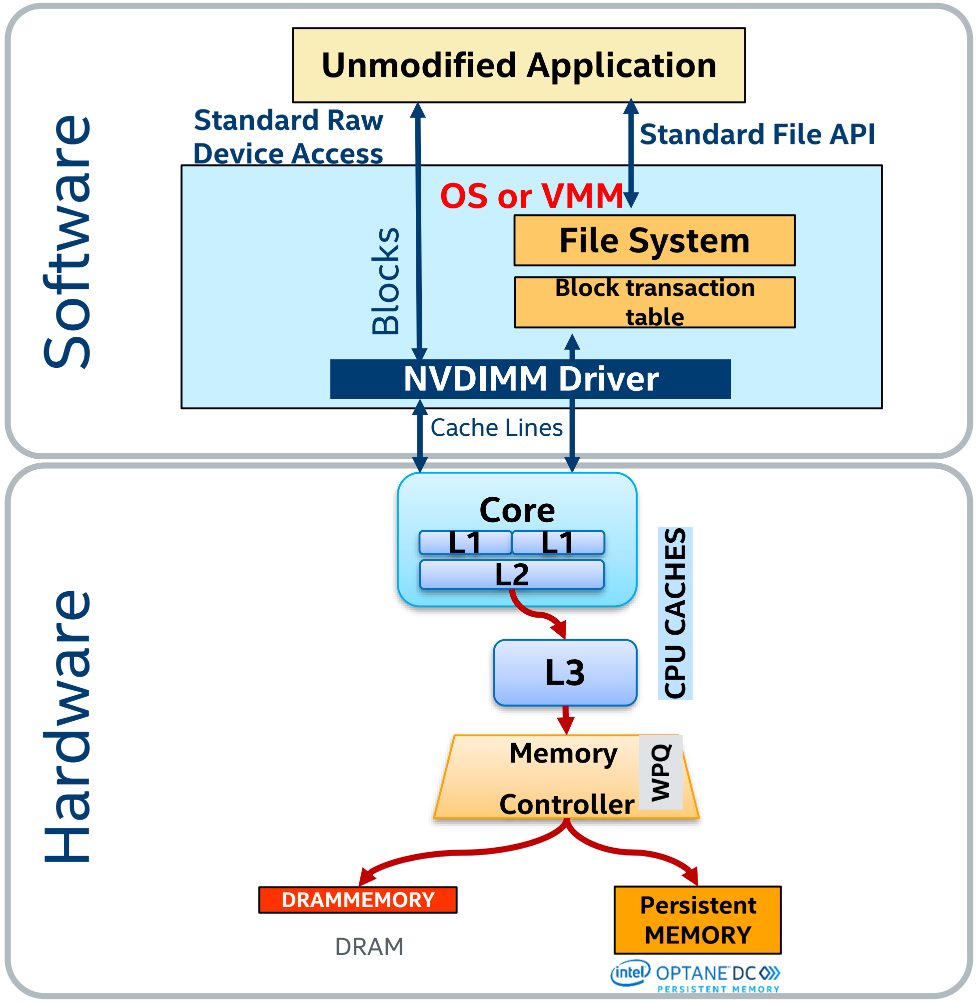
SNIA NVM PROGRAMMING MODEL



PERSISTENT MEMORY USAGE MODES

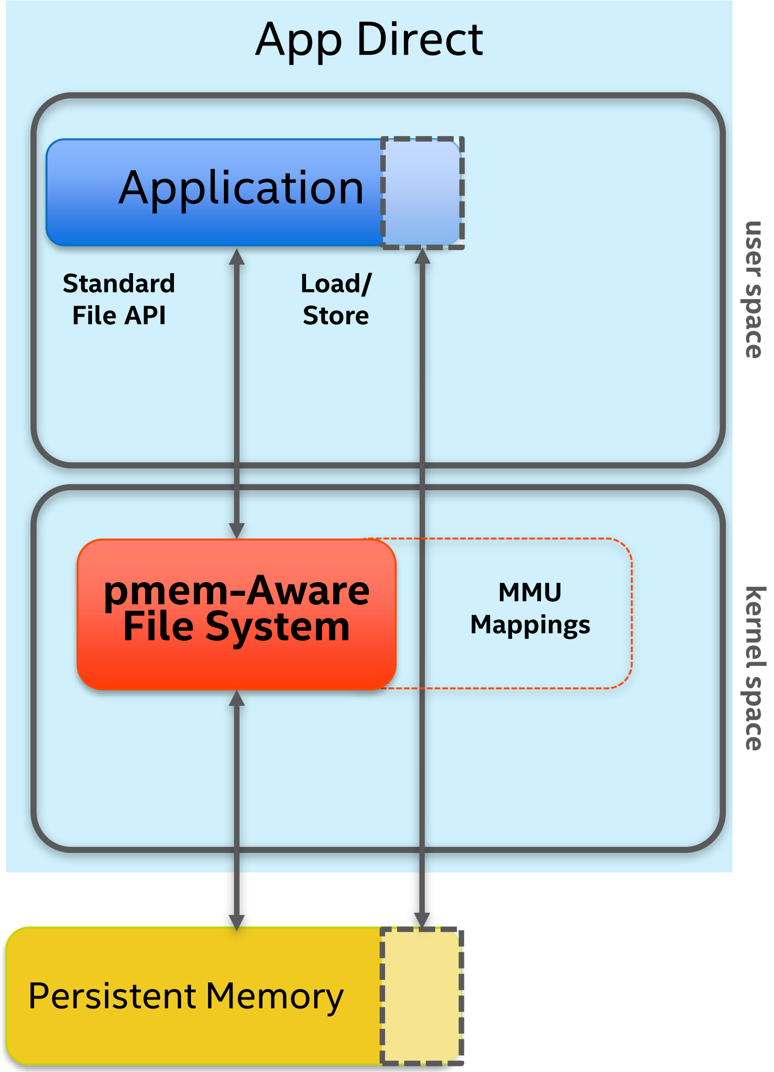
Storage Over App Direct

- Operates in blocks like SSD/HDD
  - Traditional read/write instructions
  - Works with existing file systems
  - Atomicity at block level
  - Block size configurable (4K, 512B)
- NVDIMM driver required
  - Support starting kernel 4.2
- Scalable capacity
- Higher endurance than enterprise class SSDs
- High performance block storage
  - Low latency, higher bandwidth, high IOPs



Linux kernel and driver changes: https://www.youtube.com/watch?v=owmN_lcMK2M

SNIA NVM PROGRAMMING MODEL

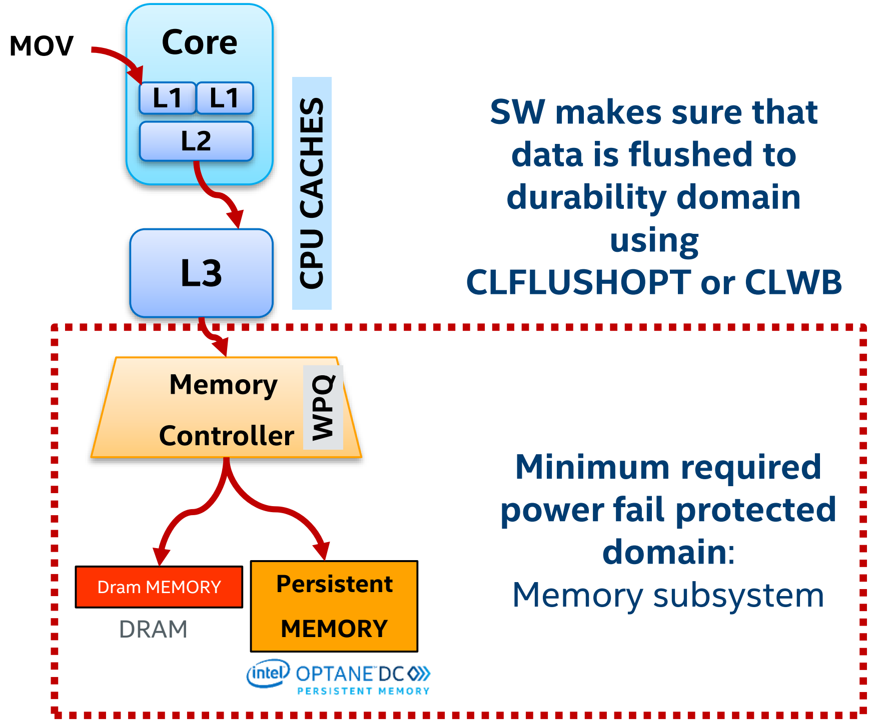


```
fd = open("/my/file", O_RDWR);
…
base = mmap(NULL, filesize,
        PROT_READ|PROT_WRITE,
        MAP_SHARED_VALIDATE|MAP_SYNC, fd, 0);
close(fd);
…
base[100] = 'X';
strcpy(base, "hello there");
msync(…);
…
```

PERSISTENT MEMORY USAGE MODES

App Direct Mode details

- PMEM-aware software/application required
  - Adds a new tier between DRAM and block storage (SSD/HDD)
  - Industry open standard programming model and Intel PMDK
- In-place persistence
  - No paging, context switching, interrupts, nor kernel code executes
- Byte addressable like memory
  - Load/store access, no page caching
- Cache Coherent
- Ability to do DMA & RDMA

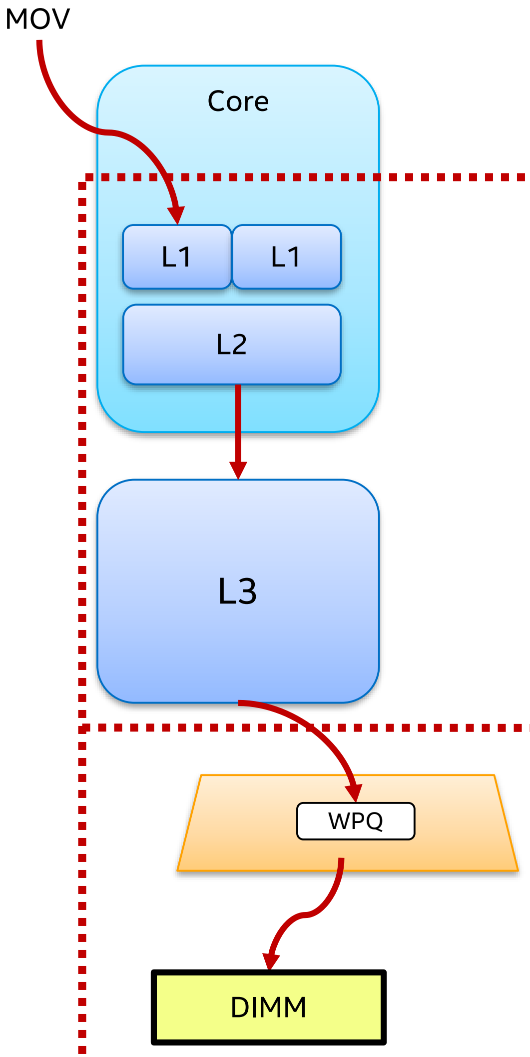


PERSISTENT MEMORY USAGE MODES
Summary

Volatile (use pmem for its capacity)		Persistent (leverage the fact pmem is persistent)	
Unmodified Apps	Modified Apps	Unmodified Apps	Modified Apps
Lowest impact Transparent for Apps	Low impact App decides on data placement	Lowest impact Apps use Storage API	Highest impact pmem-resident data structures
Memory Mode	*App Direct*	*App direct*	*App Direct*

HOW THE HARDWARE WORKS

Not shown:
ADR Failure Detection



CPU CACHES

CLWB + fence
-or-
CLFLUSHOPT + fence
-or-
CLFLUSH
-or-
NT stores + fence
-or-
WBINVD (kernel only)

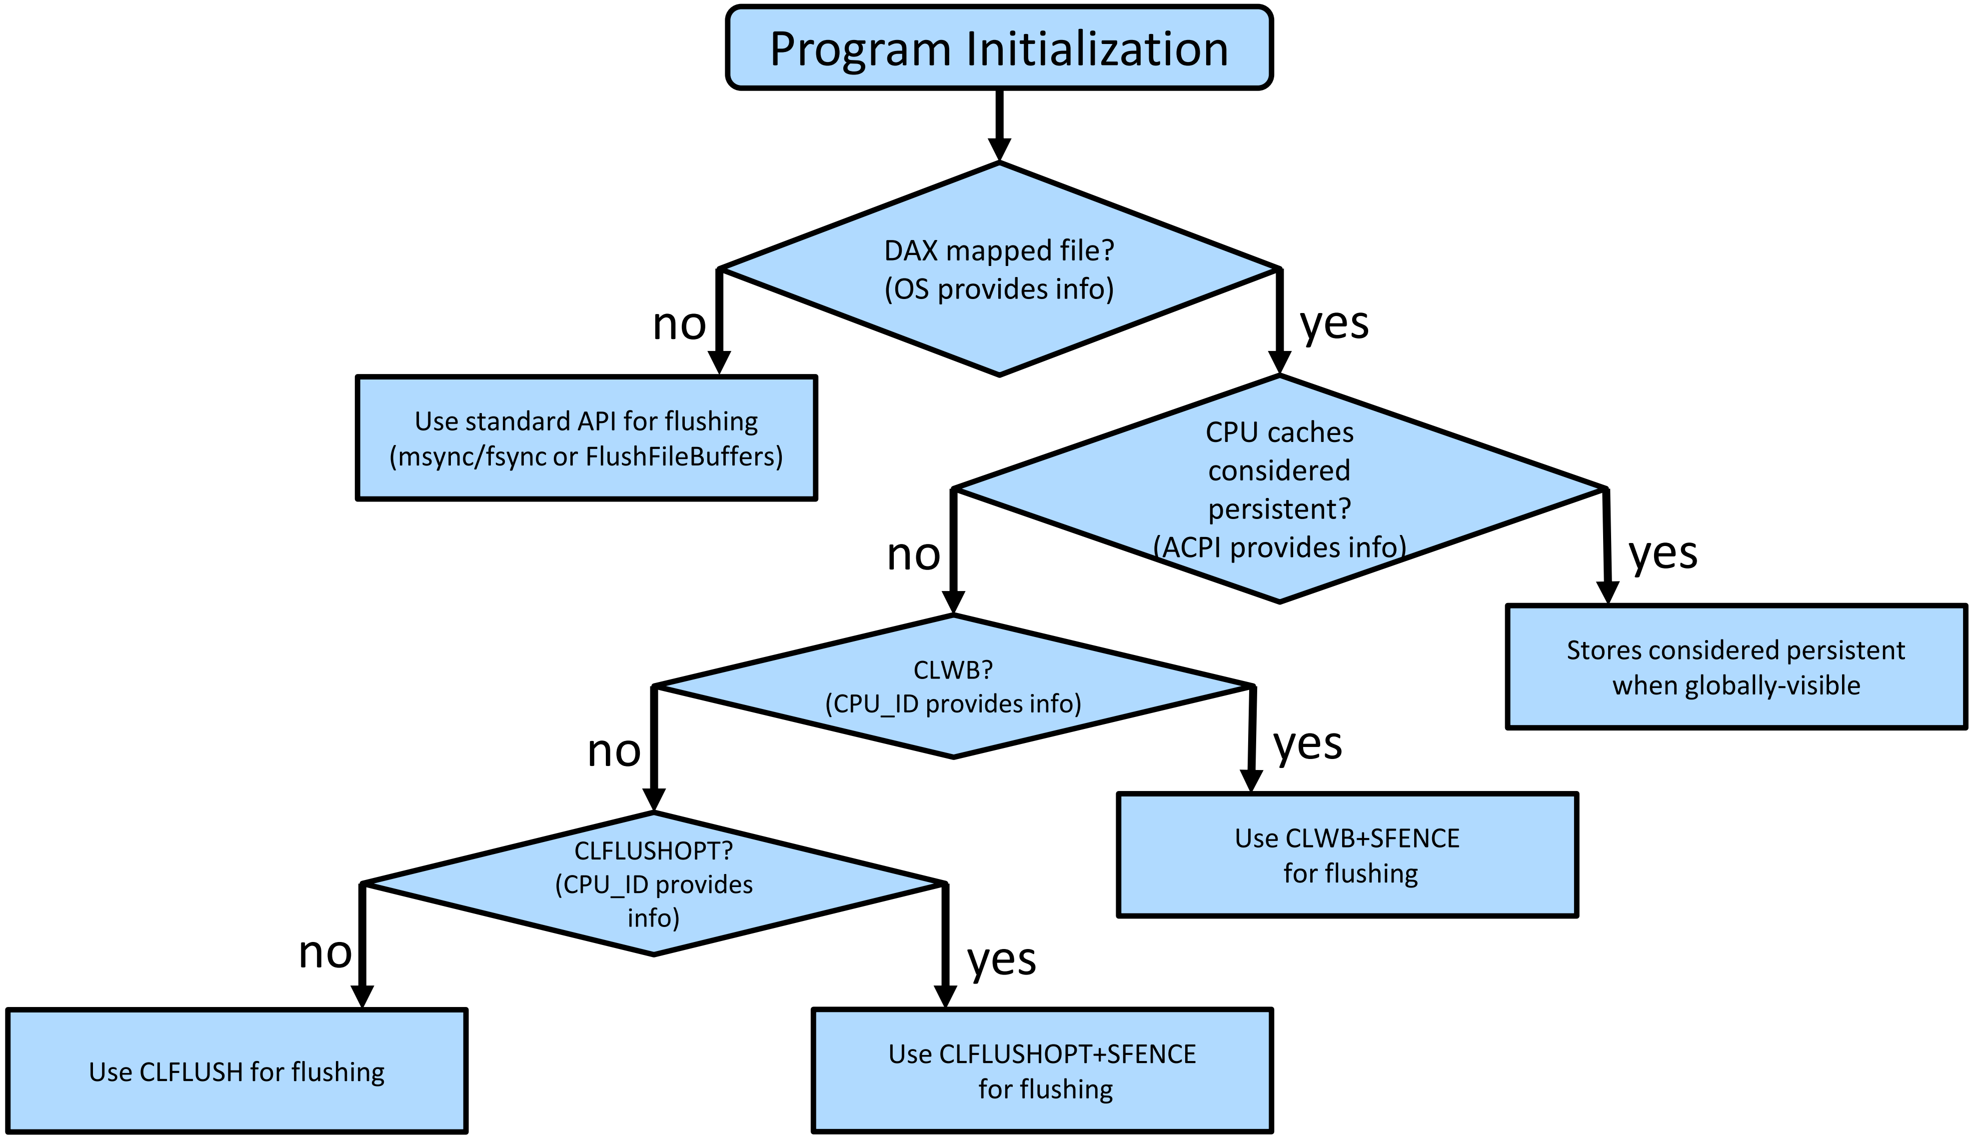
Custom
Power fail protected domain
indicated by ACPI property:
CPU Cache Hierarchy

WPQ

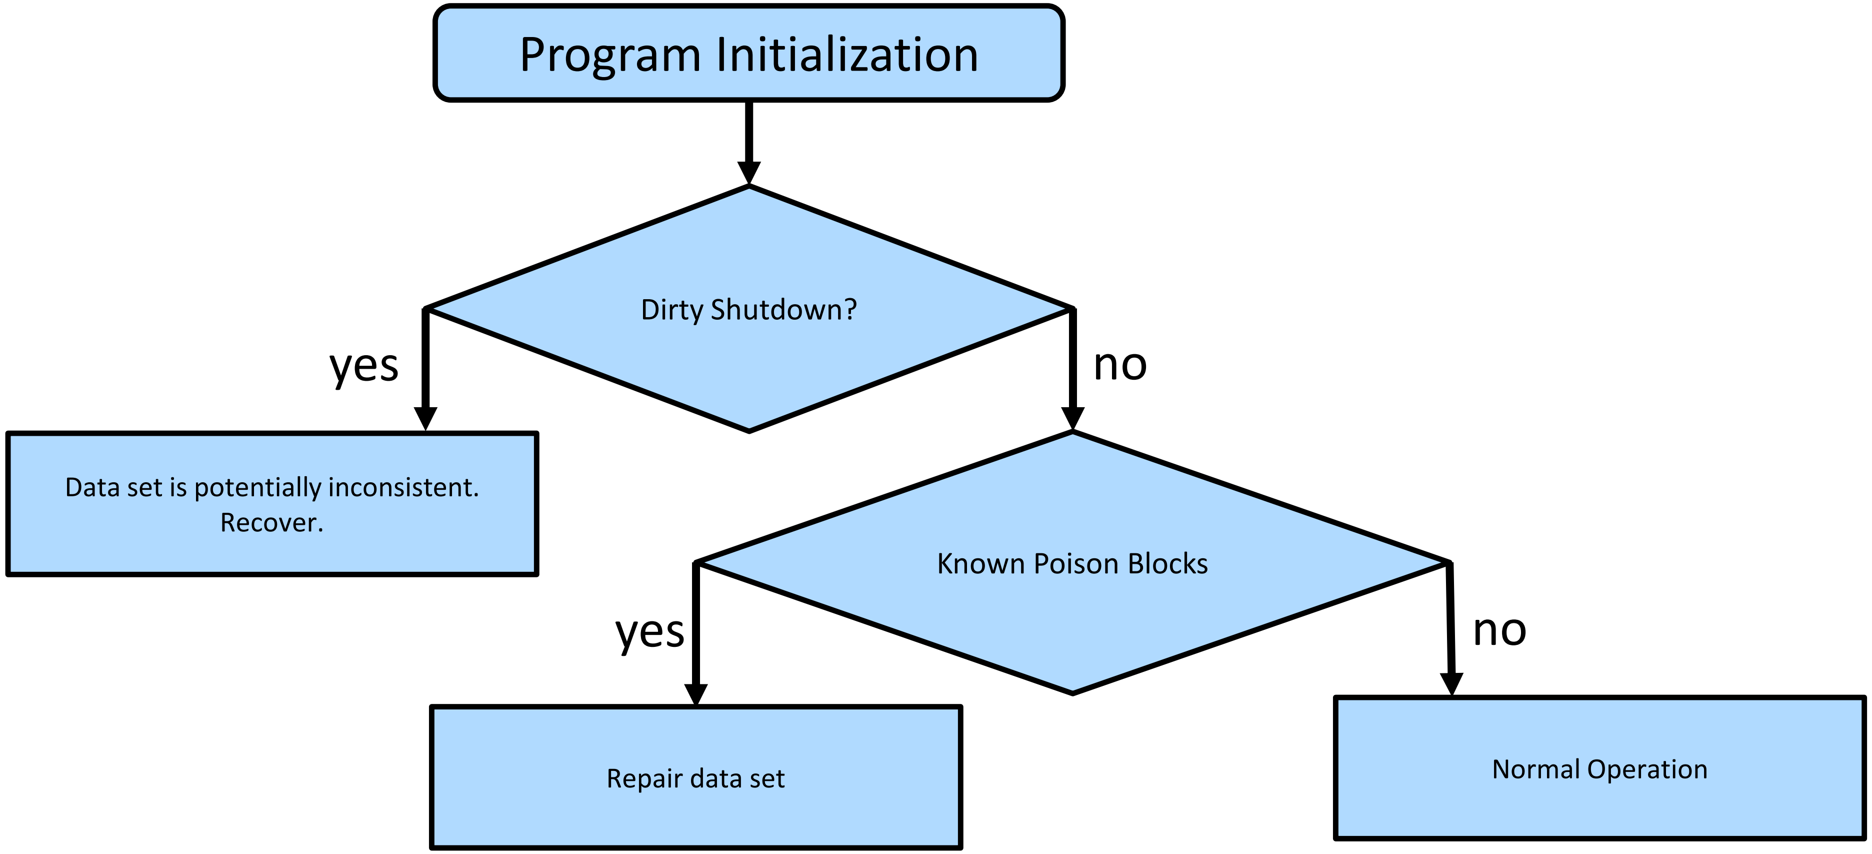
ADR
-or-
WPQ Flush (kernel only)

Minimum Required
Power fail protected domain:
Memory subsystem

APPLICATION RESPONSIBILITIES: FLUSHING



APPLICATION RESPONSIBILITIES: RECOVERY



APPLICATION RESPONSIBILITIES: CONSISTENCY

```
open(…);

mmap(…);

strcpy(pmem, "Hello, World!");

msync(…);
```

APPLICATION RESPONSIBILITIES: CONSISTENCY

```
open(…);

mmap(…);

strcpy(pmem, "Hello, World!");

pmem_persist(pmem, 14);
```

Crash

Result

```
1. "\0\0\0\0\0\0\0\0\0\0..."

2. "Hello, W\0\0\0\0\0\0..."

3. "\0\0\0\0\0\0\0\0orld!\0"

4. "Hello, \0\0\0\0\0\0\0\0"

5. "Hello, World!\0"
```

APPLICATION RESPONSIBILITIES: CONSISTENCY

```
open(…);

mmap(…);

strcpy(pmem, "Hello, World!");

pmem_persist(pmem, 14);
```

Crash

pmem_persist() may be faster,
but is still **not** transactional

Result

```
1. "\0\0\0\0\0\0\0\0\0\0..."

2. "Hello, W\0\0\0\0\0\0..."

3. "\0\0\0\0\0\0\0\0orld!\0"

4. "Hello, \0\0\0\0\0\0\0\0"

5. "Hello, World!\0"
```
